

过门流程树 ① 识别：从一帧画面到“门在哪、正不正”

根在上、看清程度分四支；每一支决定后面能算到什么

蓝色小标签 = 测试窗口第二栏原样出现的字段值（这里只有 mode）

phase=ALIGN substate=GOLDEN mode=full action=center z=1.83 dx=0.042 ...

↓ 交给下一张图：决策与动作			
判据速查 · cfg/vision.yaml → vision.gate:（下表键名省略 vision.gate. 前缀）			
看清门角	conf_thr = 0.8 · vis_thr = 0.5	姿态可信	reproj_px = 20.0 · z_min = 0.2 · z_max = 15.0 · max_z_jump_m = 0.8
候选门框	conf = 0.5	门的尺寸	frame_w = 0.70 · frame_h = 0.50
整理候选	lr_norm = true · geom_check = true · edge_tol = 0.10 · min_edges = 2	就近优先	mode = near · refine = true
